

Candlewick–Fixing Device for Burning Candlewicks

Abstract

The candlewick–fixing device replaces the need for two tools with separate functions by combining both tools at opposite ends of one adjoining handle. On one end, an O-shaped candlewick hook allows one to straighten and reposition the candlewick without having to extinguish the flame. On the other end, a bell-shaped snuffer extinguishes the flame when one places the snuffer over the flame. The bell-shaped snuffer is attached to the long handle by a hinge that allows it to be rotated horizontally. The device includes a plate to rest the bell-shaped snuffer on when not in use.
